

AIMan by brandcompete

Every leading AI model in one workspace. **Governed from the first prompt.**

Your people want Claude, GPT and Gemini today. Your IT has to know where company data goes. AIMan gives both sides what they need: one sign-in to the leading models and to open models on our own GPU servers in Germany – with answers from your documents and the web.

1

Everyone at work

- The best model for each task, without a private account
- Answers from the company's documents and wikis, with sources
- Current answers from the web
- Prompts colleagues have already perfected

2

IT, security & data protection

- One sanctioned door instead of shadow AI
- Open models and document search on servers in Germany
- SSO restricted to your domains, roles and rights
- Vendor keys held centrally, never by individuals

3

Management & finance

- One contract instead of a subscription per team
- Vendor usage billed to the company, without mark-up
- Open models without per-token fees
- A pilot that proves value before a roll-out

One chat, two models: mistral-nemo on our GPU servers in the first tab, Claude in the second.

Sensitive work stays in Germany. Open models and all document search run on dedicated GPU servers – ours, or yours on-premise. Vendor models are one tab away when a task needs them.

Vendor models: Anthropic Claude • OpenAI GPT • Azure OpenAI • Google Gemini • Cohere • Ollama Cloud

Open models on GPUs in Germany: Mistral NeMo • Qwen • Gemma • gpt-oss • Phi • DeepSeek and more

AIMan at a glance

All models, one chat

Claude, GPT, Gemini, Cohere and eleven open model families in one picker. Pick per chat – or per tab, and compare.

Answers from your documents

PDFs, Office files, web pages, Confluence, Jira and Bitbucket as data sources. Every answer cites document and page.

Prompts that work

A shared prompt repository with placeholders, categories and tags, plus custom instructions for standing context.

Chatbots & API

Export a chat tab as a chatbot for the intranet or an application. A REST API with streaming calls any deployed model by name.

Open models in Germany

Mistral NeMo, Qwen, Gemma, gpt-oss, Phi and DeepSeek on dedicated GPU servers. Prompts to them stay there. No per-token fees.

Web search & thinking

One switch per chat for current answers, sources listed underneath. Reasoning models think step by step – live, then folded away.

Projects & sharing

Shared chats with colleagues, teams or a whole department. Data sources, prompts and instructions shared the same way.

Models, people & keys under control

Admins deploy and withdraw models and see what is loaded on which GPU. Microsoft and Google SSO, roles, teams, central vendor keys.

How it works

Why AIMan

- **Your choice, visible** – local and vendor models are separate tabs, so people always see where a prompt is going
- **Document search stays home** – indexing, embeddings and reranking run on our own servers for every model; only the passages an answer needs go to a vendor model
- **One installation per customer** – its own database, search index and network; only the GPUs are shared
- **Honest answers** – every model knows today's date, and AIMan says so when nothing relevant is found
- **Made in Germany** – designed, built and supported by brandcompete GmbH, since 2016

Three ways to run it

Managed in Germany

Your installation on our dedicated GPU servers in German data centres. We host and operate it.

On-premise, managed

AIMan and the open models on GPU servers in your infrastructure, operated by us.

On-premise, self-operated

Your IT runs it under licence; brandcompete provides releases, models and support.

In daily use

By teams at a DAX-listed automotive supplier and at agencies of a leading European media group.

Your keys, your bill

Vendor models run under your company's own keys and are billed by the vendor, to you.

Your look

Your colours and logo on every installation, light and dark themes.

Start with a pilot

One department, real tasks, your own documents – and a decision based on evidence after a few weeks rather than on a demo.
